

DECOMMISSIONING / SERVICE BRIEF

Plan the exit. Preserve the options.

A facility transition involves assets, materials, utilities and future use. NorthStar connects decommissioning, dismantlement and recovery into an accountable scope.

What leaves. What stays. What follows.

The right plan distinguishes equipment for recovery from materials for removal. It also defines utility interfaces, environmental work and the condition needed for the next phase.

DISMANTLEMENT | ASSET RECOVERY | SPECIALIST COORDINATION

CAPABILITIES / SCOPE PLANNING

Connect each workstream to the transition.

Use one scope discussion to identify dependencies. Establish the appropriate NorthStar delivery team and technical specialists for each facility, material and regulatory context.

Dismantle and recover

Plan equipment removal, rigging, salvage and asset-recovery needs against the owner's retention decisions.

Integrate environmental work

Connect abatement, decontamination and material handling with the dismantlement sequence.

Protect the interfaces

Identify retained utilities, neighboring operations and the information needed to authorize each transition.

Bring in specialist services

NorthStar's wider services include facility response and nuclear decommissioning. Those engagements require their own specialist scope and delivery team.

12

sortation units / 2020
project

ProLogis / FedEx, Mount Juliet

NorthStar's project account describes dismantling, cataloging, crating and relocating 12 sortation units, then rebuilding them at another ProLogis facility.

Company-reported 2020 project; source file modified April 18, 2026.

01

Separate retain, relocate, recover and remove decisions.

02

Identify utility isolation owners and specialist interfaces.

03

Agree on asset documentation, turnover and site end condition.
