

TECHNOLOGY / RECOVERY & READINESS

Physical recovery for the places your technology depends on.

Sensitive operations rely on physical spaces with specific requirements. NorthStar addresses property damage and repairs alongside your facilities team, while technical owners direct system isolation, testing, restart and acceptance.

Set the boundaries around sensitive systems.

Water, smoke and damaged materials can affect spaces that support digital and research operations. Physical recovery needs agreed access, environmental requirements and clear technical handoffs. NorthStar works within the property assignment; your technical owners retain decisions about the systems they control.

40+ years of experience

Critical facilities · Site operations · Technical owners and EHS

RELEVANT EXPERIENCE / THE WORK BEHIND THE RESULT

Pentagon: adjacent experience in a complex facility

Phased

work around active building services

Pentagon Renovations | 2001–2011

Pentagon renovations during 2001 to 2011 demonstrate adjacent government-facility experience in phased abatement and demolition around active services. This example does not establish direct data-center project experience for NorthStar.

01 The challenge

The Pentagon's 2001 to 2011 renovation program required abatement and interior demolition while military operations and essential building services continued. Security procedures and active systems passing through work areas shaped the project. This is adjacent government-facility experience, not a data-center engagement.

02 The work

NorthStar Group Services performed abatement and demolition across more than four million square feet. Crews separated occupied areas with hard walls and dust barriers, arranged tenant movements and worked through controlled access procedures. Phased scheduling preserved active mechanical, electrical and plumbing services that crossed work zones, with major system work assigned to off-peak periods.

03 The milestone

The project reported no mechanical, electrical or plumbing interruptions from NorthStar's work. That result belongs to this government-facility project; it is not a technology-site uptime commitment or evidence of direct data-center work.

MORE RELEVANT EXPERIENCE

AIG Campus Recovery | 2017

Coordinated physical recovery

Following Hurricane Harvey, recovery prioritized four office-campus buildings with temporary power and environmental support. Office-campus experience; not a data-center case.

BEFORE THE NEXT INTERRUPTION

Bring technical owners into the property plan.

Begin with facilities, EHS and the specialists responsible for critical systems. Review the physical recovery assignment alongside access controls, environmental requirements and the approvals needed before each technical handoff.

Critical spaces

Which rooms and supporting areas need particular access controls or environmental conditions?

Authorized work

Who approves entry, work boundaries and activity near sensitive systems?

Technical handoffs

Which specialists direct isolation, testing, restart and acceptance, and what project information do they need?

CAPABILITIES TO SHAPE YOUR PLAN

 Physical damage assessment

 Mold remediation

 Water extraction and structural drying

 Selective demolition

 Fire and smoke restoration

 Repair and reconstruction

YOUR NEXT CONVERSATION

Review your critical-space recovery plan

Bring your facilities and technical owners into a NorthStar discussion about site requirements, authorized access and the physical recovery work appropriate for your property.
