

ABATEMENT / SERVICE BRIEF

Control the conditions. Clear the path.

NorthStar brings hazardous-material abatement into renovation, demolition and facility renewal plans that account for the surrounding environment.

SELECTIVE WORK / PROTECTED INTERIORS

A different scope. A different work environment.

Material identification, containment, access and clearance requirements define abatement work and the handoff to the next trade. Each needs its place in the project plan.

ASBESTOS | LEAD | MOLD | HAZARDOUS MATERIALS

CAPABILITIES / SCOPE PLANNING

Bring the material conditions into the plan.

Start with the available surveys and the intended use of the space. Coordinate the abatement scope with occupants, facilities teams, environmental consultants and the construction schedule.

Address identified materials

Scope asbestos, lead, mold and other hazardous or universal waste work against the site's documented conditions.

Plan the work environment

Coordinate work zones, containment needs, access and adjacent-use constraints for the specific engagement.

Connect the trades

Align abatement with selective demolition, renovation or decommissioning activities.

Define the handoff

Establish documentation, testing responsibilities and completion requirements before the next phase begins.

18,000+

project hours / 2022-2023

Mass General Hospital, Boston

NorthStar's published project account reports more than 18,000 hours without an OSHA recordable during demolition and abatement work.

Company-reported project result; applies to the stated project period.

01

Share material surveys, test results and building-use requirements.

02

Map occupied areas, access routes and construction interfaces.

03

Agree on clearance responsibilities and the next-trade handoff.

Discuss your abatement requirements →
