

ABATEMENT / QUALIFICATIONS

Qualify the material work and the surrounding environment.

Abatement procurement needs more than a material list. NorthStar connects asbestos, lead, mold and other hazardous-material work with occupancy, work-area controls and the requirements for the next phase.

INDUSTRIAL SERVICES / PROCESS STRUCTURES

The setting changes the assignment.

A vacant facility, active hospital and occupied commercial building present different interfaces. Evaluate the proposed abatement scope against the building's use, available surveys and project-specific release requirements.

MATERIAL-SPECIFIC SCOPE | CONTROLLED WORK AREAS | DOCUMENTED HANDOFF

QUALIFICATIONS / RELEVANT CAPABILITY

Four dimensions of an abatement qualification review.

Ask how the proposed scope responds to the materials and how the team will coordinate with the people responsible for the building and its construction program.

Documented material conditions

Identify the surveys, sampling information, locations and quantities available for pricing and planning. Establish how additional findings will be assessed and communicated.

Work-area requirements

Review proposed boundaries, access and containment needs for the specific material and setting. Coordinate building interfaces with the owner and relevant environmental professionals.

Sequence and supervision

Discuss how abatement will connect with selective demolition and adjacent work. Review proposed supervision and task planning against the site's safety requirements.

Testing and release

Define sampling, monitoring, clearance and documentation responsibilities where applicable. Agree on the evidence required before affected areas move into the next phase.

18,000+

Project hours · 2022-2023

Mass General Hospital, Boston

NorthStar reports more than 18,000 hours without an OSHA recordable during the project's demolition and abatement work. This is a company-reported result for the named project and period.

OWNER CONVERSATION / DEFINE THE WORK

Make the qualification request match the setting.

A focused request helps owners, EHS teams and construction managers compare relevant evidence. Keep technical responsibilities visible throughout the review.

01

Material and project fit

Request comparable experience for the identified materials and building conditions, including occupied or otherwise constrained settings when relevant.

02

Current scope credentials

Request licenses, training records and other credentials required for the proposed location and work. Confirm the responsible delivery entity and personnel.

03

Facility coordination

Identify facility contacts, environmental consultants and adjacent trades. Define responsibilities for access, work-area changes and communications affecting occupied areas.

04

Completion documentation

Specify the required records and acceptance process, including applicable waste documentation, monitoring or clearance results and any owner-retained verification.

NorthStar's abatement qualifications should answer your material, building and handoff questions together. Begin with the available surveys and the conditions the work must respect.
