

ENVIRONMENTAL SERVICES / PLANNING GUIDE

Connect the site's conditions to its intended next use.

For property owners, EHS teams and redevelopment leaders, NorthStar connects environmental remediation with material handling, civil interfaces and restoration. Begin with the site evidence and the outcome the work must support.

MATERIAL RECOVERY / INDUSTRIAL SITES

Soil, water and materials move together.

Remediation decisions can affect excavation, stockpiles, water management and restoration. Bring those workstreams into the same scope discussion, with the relevant environmental professionals and acceptance responsibilities identified.

SITE EVIDENCE | MATERIAL PATHWAYS | RESTORATION OUTCOMES

QUALIFICATIONS / RELEVANT CAPABILITY

Follow the conditions through the work plan.

The site investigation, work sequence and intended finish should inform one another. Use four connected questions to organize the early discussion.

What is documented?

Review available investigations, sampling data and material records. Identify information gaps and the professionals responsible for interpreting conditions and defining technical requirements.

Where will materials go?

Discuss segregation, stockpiling, reuse and off-site pathways against the site's requirements. Coordinate handling areas and access with other workstreams.

How does water interact?

Bring drainage, water-management and dewatering requirements into the work discussion where relevant. Connect environmental responsibilities with the proposed civil activities.

What defines completion?

Establish restoration and acceptance requirements with the owner and relevant specialists. Define required records and verification responsibilities before the work reaches its final stage.

3,100

Gross tons · Metal recycled

Air Products, Texas City 2TX | 2023-2024

The NorthStar profile records 3,100 gross tons of metal recycled and 4,000 cubic yards of concrete reused within a combined demolition, abatement and site-restoration project.

NorthStar project profile · Modified August 27, 2025

OWNER CONVERSATION / DEFINE THE WORK

Turn the first meeting into a useful scope review.

Bring the environmental, operational and property perspectives together. The following inputs help the delivery discussion stay tied to the site's actual requirements.

01

Known conditions

Provide investigations, test results, prior site uses and known affected areas. Distinguish confirmed findings from conditions still under evaluation.

02

Technical responsibilities

Identify environmental consultants, engineers and approval authorities involved. Clarify who establishes requirements, verifies results and accepts the completed work.

03

Material and access routes

Map available handling areas, retained operations and access limits. Discuss potential reuse or recovery only within the documented technical and project requirements.

04

Restoration and next use

Describe the intended property condition, retained features and next phase. Agree on the records and site criteria needed for turnover.

Bring NorthStar the available site evidence and the outcome you need. A coordinated review can then connect remediation, materials and restoration to a defined scope.
