

ENVIRONMENTAL SERVICES / SERVICE BRIEF

Connect the cleanup to the next use.

Environmental work should support a defined site outcome. NorthStar brings remediation and restoration capabilities to complex industrial and property transitions.

SITE TRANSITION / RETAINED INFRASTRUCTURE

**Follow the material.
Define the outcome.**

Soil, water, structures and residual materials can create connected workstreams. Plan their handling together, with the site's environmental requirements and future condition in view.

REMEDIATION | WATER & SOIL | MATERIAL RECOVERY

CAPABILITIES / SCOPE PLANNING

A coordinated path through complex site work.

Bring environmental requirements, civil work and material handling into the same scope discussion. Establish the specialists, responsibilities and acceptance criteria for the work.

Remediate affected areas

Connect environmental remediation with the conditions identified for the site and its materials.

Address soil and water

Discuss water-resource management, dredging and soil-stabilization requirements with the relevant specialists.

Manage residual materials

Plan material segregation, recovery and disposal pathways alongside demolition or decommissioning.

Restore the site

Align grading and restoration with the agreed end condition; specialized scopes can include impoundment, landfill and coal-ash work.

4,000

cubic yards / concrete reuse

Air Products, Texas City 2TX | 2023-2024

The project profile records demolition, abatement and site restoration, including reuse of 4,000 cubic yards of concrete and recycling of 3,100 gross tons of metal.

NorthStar project profile, modified August 27, 2025. Project-specific quantities.

01

Provide site investigations, material records and applicable requirements.

02

Define material routes and coordination with ongoing site activities.

03

Set the restoration and turnover criteria for the next use.
