

MEDICAL / THE RECOVERY PRIORITIES

Facility recovery that works with your care environment.

Coordinate physical facility recovery with your engineering, infection-prevention and emergency-management teams, from site review through restoration and repair.

Plan the work around the facility.

A hospital wing, outpatient center and medical office have different recovery needs. NorthStar works with designated facility teams to define physical recovery scope, coordinate work areas and plan repairs. Facility leadership directs care decisions and the return of space to use.

Reconstruction

MEDICAL / FROM SCOPE TO HANDOFF

A coordinated path through the work.

Define the physical recovery scope, connect the responsible teams and agree on the decisions needed at each stage.

01 Review the facility

Bring available building information and designated facility contacts together. Identify affected spaces and the priorities guiding recovery.

02 Coordinate the scope

Review proposed work with engineering and infection prevention. Align boundaries, access and sequencing with facility-directed requirements.

03 Carry out agreed recovery

Perform the agreed physical restoration and remediation work, coordinating with facility teams and relevant specialist contractors.

04 Support the facility handoff

Complete agreed repairs and provide work-status information. The facility's authorized teams determine the next steps for returning spaces to use.

The people behind the decisions.

Facilities and engineering

Guide building access, utility coordination, site information and the physical requirements for recovery.

Facility care and safety teams

Set infection-control requirements and care priorities, review proposed work and direct decisions about returning spaces to use.

NorthStar recovery team

Coordinate agreed restoration, remediation and repairs with the facility's designated teams and recovery process.

SERVICES TO SHAPE THE SCOPE

- Water damage recovery
- Fire and smoke restoration
- Microbial remediation
- Hazardous-material abatement
- Selective demolition
- Repair and reconstruction

MEDICAL / THE NEXT CONVERSATION

Relevant experience. Real project scope.

North Central Bronx Hospital | 2020 ↗

100,000+ sq ft / eight floors

An intensive four-week preparation effort supported the hospital's wider ICU reconstruction program.

Preparatory facility work; not completion of the entire clinical expansion.

LSU Student Health Center ↗

A phased return of space

Following a fire, the east wing reopened in two weeks while the more damaged west wing was prepared for reconstruction.

Two weeks applies to the east wing only.

Four questions to bring forward.

- 01 Which facility teams define recovery priorities and review proposed work?
- 02 What occupied areas, adjoining departments and access routes must the work account for?
- 03 Which utility and water-management contacts need to participate in planning?
- 04 What work records and completion reviews do authorized facility teams need for the handoff?

Bring the right teams into the conversation.

Meet with NorthStar, facilities, infection prevention and emergency management to review site information, communication and recovery priorities.
